

Data Access

Access to all MWA visibility data is now via the MWA node of the All Sky Virtual Observatory (ASVO). The **MWA ASVO** provides a web interface, as well as a command line interface and API to access raw uncalibrated or calibrated visibility data. The raw visibility data is in an MWA-specific format, so we also offer the ability to convert the data into a CASA measurement set or uvfits format. When converting visibilities to these standard formats, there are options to also frequency or time average the data- thus reducing the size of the download.
